### RESEARCH INTERESTS

---

I am an evolutionary biologist broadly interested how animal evolution is constrained and guided by interactions with the physical world. I am currently an NSF postdoctoral fellow studying how lung structure and airflow biomechanics evolved with diving and explosive ventilation in marine mammals at the University of British Columbia. My PhD research investigated the evolution of **unidirectional pulmonary airflow** patterns in monitor lizards using open source **computational fluid dynamics** simulations. I also used **XROMM** to investigate the evolution of the axial skeleton and aspiration breathing in tetrapods. As a postdoc, I used musculoskeletal models to ask how the biomechanical scaling drove locomotor innovations and adaptive evolution in Australian varanid lizards.
